I Model design framework

Freeze case and population

One allegation + official response
Synthetic profiles; fixed network

Tested associations and moderation

Test DGC × RT, TC and GC

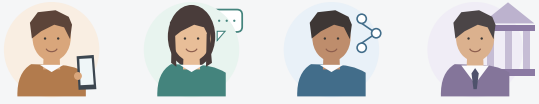

54-cell controlled factorial design

Response timing	Targeting capacity
RT = 2, 4, 7	TC = .20, .80
Government credibility	**Group cocooning**
GC = .25, .50, .75	DGC = 0, .20, .40

300 LLM users · 54 scenarios × 10 rounds

One stochastic trajectory per parameter cell

II Agent design and simulation

Demographics · MBTI · trust · habits
Prior score · 3-step memory · actual exposure

Begin round t
Retain the previous 3 rounds
Publish the official response if t = RT

Construct the visible feed
Following, reposts and revisits
≤30 earlier comments per visible root

MiniMax-M3 decision
Integrate all 11 assigned conditions
Score, comment and repost choices

Validate and commit
>50 believe; ≤50 reject
Record events; social actions visible at t + 1

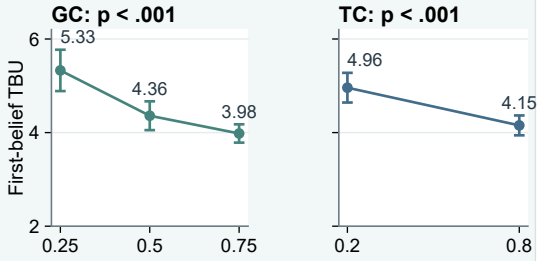

t ← t + 1

Publishers are scripted; only audience users call the LLM.

III Results and inference

Scenario-level TBU → HC3 OLS + F / t + Holm

54 runs; two matched TBU clocks

DGC level difference: Holm p = .272
